

Frontend Assessment (ReactJS)

Important Submission Checklist

Please make sure your assessment is fully completed and tested before submission. As ReactJS is the core requirement for this role, the application must be developed using ReactJS rather than plain JavaScript or another framework.

To achieve a high score, please check the following:

- Complete every requirement stated in the assessment.
- Allow searches using both city and country.
- Display a clear message for invalid searches or API errors.
- Include working search, clear, search-again and delete buttons.
- Save the search history so it remains after the page is refreshed.
- Ensure the design works well on both desktop and mobile.
- Use clean, readable and reusable ReactJS components.
- Include loading states and handle different edge cases.
- Run the lint, type-check and build commands with no errors.
- Remove unused code and unfinished functions.
- Include clear setup instructions and assumptions in the README.
- If possible, add automated tests and a light/dark theme.

Please test every button and function carefully before submitting. The final application should be complete, responsive and easy for the reviewer to run.
